

KeyRemap

“ Redefine the behavior of a physical key to act as another key or to launch an app. ”

➔ Two main Remap Functions

Key Benefits

Remap a physical key to act as another key, or to launch an application when the key is pressed.

Send an Android broadcast intent when a key is pressed or when released, this enables the ability to integrate functions with third party apps.

When the device screen is suspended, a key can be configured to wake the screen up.

Easy migration of KeyRemap settings to another device, using the Export and Import features.

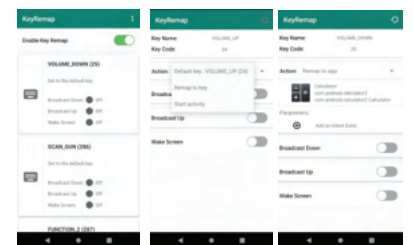

01 Remap to Key

Remap a key to another keycode can be useful when your business app needed to use a specific keycode. Another use of this function is to remap the key to do nothing.

02 Remap to App

Remap a key to launch an app can be useful when you wish to launch an app and then send broadcast intents to the app for processing, example such as a real-time voice communication app.

➔ Setting Migration

To easily take the configuration from one device to another, export the settings from the source device, copy the setting file onto the destination device and then perform an import.
